---

**Fish are being threatened by rising levels of man-made noise pollution.** Scientists who have reviewed the impact on fish species around the world of noises made by oil and gas rigs, ships, boats and sonar have concluded this in a paper published in Trends in Ecology and Evolution. Fish do not live in a silent world; they can hear quite well and sound places an important part in their lives. It appears that increasing noise levels severely affect the distribution of fish, and their ability to reproduce, communicate and avoid predators.
